

has begun to use the Speech Easy Device to help his speech become more fluent. The device can be seen in the left ear.

The **Speech Easy** is the smallest, most advanced, new device for the problem of stuttering. It is small enough to fit completely in your ear canal, yet it uses an advanced microprocessor that has all the power found in a computer. The Speech Easy is digitally programmable with special computer software for a wide range of settings of Delayed Auditory Feedback (DAF) and Frequency Altered Feedback (FAF). Speech Easy fluency devices are based on a natural phenomenon called the “choral effect.” The “choral effect” occurs when people who stutter speak or sing in unison with others and their stuttering is dramatically reduced or even eliminated.

Attached you will find a questionnaire. By you completing the questionnaire, it will help me assess the effectiveness of the Speech Easy Device outside of speech therapy sessions.

I sincerely appreciate your time,
